space 2 table columns width 50 flex

To make two flexbox columns take 50% width each inside a container, set the parent element to `display: flex` and give each child column a size using `flex: 0 0 50%` or `width: 50%`. Stack Overflow +1

CSS Code Example

- `.container { display: flex; flex-wrap: wrap; }`
- `.column { flex: 0 0 50%; box-sizing: border-box; }` Stack Overflow +4

Adding Space (Gaps)

- Use `gap: 16px;` on the parent container.
- Or use `width: calc(50% - 8px);` on the columns with `justify-content: space-between;` on the parent. Adobe +1

If you want to add a **specific gap size**, a **responsive breakpoint**, or see an **HTML snippet**, tell me how you want to adjust the layout.

I have a Div with a table containing 2 columns and want the table columns to be spaced evenly across the container

To space two table columns evenly across a `div` container using flexbox, apply `display: flex` to the row elements, not the table itself. [🔗](#)

CSS Solution

- `table { width: 100%; border-collapse: collapse; }`
- `tr { display: flex; width: 100%; }`
- `th, td { flex: 1; text-align: left; }` [🔗](#)

How It Works

- `tr { display: flex; }` turns each table row into a flex container.
- `flex: 1;` forces both columns to grow equally and occupy exactly 50% of the width.
- `width: 100%;` ensures the table stretches to fill the outer `div` completely. [🔗](#)

If your table has **borders, padding requirements**, or needs a **fixed gap** between the columns, let me know so I can adjust the code.
